

Name: _____

Date: _____

Learning Goal 4.2	I can graph and describe linear relations.
--------------------------	--

an equation for a

There are 3 ways to represent a line for graphing

1. Slope - intercept form

2. slope - point form

3. standard form

slope = $\frac{\text{rise}}{\text{run}} = \frac{\text{vertical change}}{\text{horizontal change}}$

$y = mx + b$
 - m is also slope
 - b is y-intercept (where the line crosses the vertical axis)

$y - y_1 = m(x - x_1)$
 - line passes through the point (x_1, y_1)

$Ax + By = C$
 - A, B, C are whole # (0, 1, 2, 3, ...) integers (... -2, -1, 0, 1, 2, ...)
 * no decimals or fractions

Example 1 Graph the following lines on the grid provided.

$y = 3x + 2$

slope $3 = \frac{+3}{+1}$ ← up 3, right 1
 $= \frac{-3}{-1}$ ← down 3, left 1

$y = \frac{1}{3}x + 2$

slope $\frac{1}{3} = \frac{+1}{+3}$ ← up 1, right 3
 $= \frac{-1}{-3}$ ← down 1, left 3

$y = -3x - 4$

slope $-3 = \frac{-3}{+1}$ ← down 3, right 1
 $= \frac{+3}{-1}$ ← up 3, left 1

$y = -\frac{1}{3}x - 4$
 slope $-\frac{1}{3} = \frac{-1}{+3}$ ← down 1, right 3
 $= \frac{+1}{-3}$ ← up 1, left 3

Example 2 Graph the following lines on the grid provided.

Standard form

$x + 4y = 8$

x-int ($y=0$): $x + 4(0) = 8 \Rightarrow x = 8$
 y-int ($x=0$): $(0) + 4y = 8 \Rightarrow 4y = 8 \Rightarrow y = 2$

Assignment

$4x + y = 8$

x-int ($y=0$): $4x + (0) = 8 \Rightarrow 4x = 8 \Rightarrow x = 2$
 y-int ($x=0$): $4(0) + y = 8 \Rightarrow y = 8$

Handout

$3x + 4y = 12$

x-int ($y=0$): $3x + 4(0) = 12 \Rightarrow 3x = 12 \Rightarrow x = 4$
 y-int ($x=0$): $3(0) + 4y = 12 \Rightarrow 4y = 12 \Rightarrow y = 3$

Quiz Next Day!

Example 1 Start at the y-intercept, move by the slope

Example 2 Calculate the x - and y -intercepts, connect the dots.

Example 3 Graph the following lines on the grid provided.

slope-point form

$$y - \underset{y_1}{2} = \frac{1}{2}(x - \underset{x_1}{6})$$

$$\text{slope} = \frac{1}{2}$$

$$= +1 \leftarrow \text{up } 1$$

$$+2 \leftarrow \text{right } 2$$

$$= -1 \leftarrow \text{down } 1$$

$$-2 \leftarrow \text{left } 2$$

point
(6, 2)

$$y + 2 = \frac{1}{2}(x + 6)$$

$$\underset{y_1}{-(-2)} \quad \underset{x_1}{-(-6)}$$

$$\text{slope} = \frac{1}{2}$$

$$= +1 \leftarrow \text{up } 1$$

$$+2 \leftarrow \text{right } 2$$

$$= -1 \leftarrow \text{down } 1$$

$$-2 \leftarrow \text{left } 2$$

point
(-6, -2)

$$y - \underset{y_1}{2} = -2(x - \underset{x_1}{6})$$

$$\text{slope} = -2$$

$$= -2 \leftarrow \text{down } 2$$

$$+1 \leftarrow \text{right } 1$$

$$= +2 \leftarrow \text{up } 2$$

$$-1 \leftarrow \text{left } 1$$

point
(6, 2)

$$y + 2 = -2(x + 6)$$

$$\underset{y_1}{-(-2)} \quad \underset{y_2}{-(-6)}$$

$$\text{slope} = -2$$

$$= -2 \leftarrow \text{down } 2$$

$$+1 \leftarrow \text{right } 1$$

$$= +2 \leftarrow \text{up } 2$$

$$-1 \leftarrow \text{left } 1$$

Example 4 Graph the following lines on the grid provided.

$$y - 2 = 0$$

$$+2 \quad +2$$

$$y = 2$$

⇒ no matter
what value x
is, $y = 2$

⇒ horizontal line.

$$y = -2$$

⇒ no matter
what value x
is, $y = -2$

⇒ horizontal
line.

$$x + 3 = 0$$

$$-3 \quad -3$$

$$x = -3$$

⇒ no matter
what value
 y is, $x = -3$

⇒ vertical
line

$$x = 3$$

⇒ no matter
what value
 y is, $x = 3$

⇒ vertical
line
