<b>Learning Goal 4.2</b>	Solving first- and second-degree equations over restricted domains and all real numbers.
--------------------------	--

When solving a quadratic equation,

1. Factor and set each bracket equal to zero
2. Completing the square.
3. Quadratic Formula.

$$x = \frac{-b \pm \sqrt{b^2 - 4ac}}{2a}$$

$$\begin{aligned} x^2 + 2x &= 8 \\ x^2 + 2x - 8 &= 0 \\ \underline{+4} \quad \underline{x \cdot 2} &= -8 \\ \underline{+4} \quad \underline{+2} &= 2 \\ (x+4)(x-2) &= 0 \\ \downarrow \qquad \qquad \downarrow \\ x+4=0 \quad x-2=0 \\ x=-4 \quad x=2 \end{aligned}$$

$$\begin{aligned} x^2 + 2x &= 8 \\ \underline{+4} \quad \underline{x \cdot 2} &= -8 \\ \underline{+4} \quad \underline{+2} &= 2 \\ (x+4)(x-2) &= 0 \end{aligned}$$

$$\begin{aligned} &= \frac{-2 \pm \sqrt{(2)^2 - 4(1)(-8)}}{2(1)} \\ &= \frac{-2 \pm \sqrt{4 + 32}}{2} \end{aligned}$$

$$\begin{aligned} &= \frac{-2 \pm \sqrt{36}}{2} \\ &= \frac{-2 \pm 6}{2} \end{aligned}$$

$$\begin{aligned} &\rightarrow x_+ = \frac{4}{2} = 2 \\ &\rightarrow x_- = \frac{-8}{2} = -4 \end{aligned}$$

**Example** Solve  $\tan^2 \theta - 5 \tan \theta + 4 = 0$  for  $0 \leq \theta < 360^\circ$ . Give solutions as exact values where possible. Otherwise give approximate angle measures to the nearest hundredth of a degree.

$$\begin{aligned} x^2 - 5x + 4 &= 0 \\ \underline{-4} \quad \underline{x \cdot -1} &= 4 \\ \underline{-4} \quad \underline{+ -1} &= -5 \end{aligned}$$

$$\begin{aligned} \underline{-4} \quad \underline{x \cdot -1} &= 4 \\ \underline{-4} \quad \underline{+ -1} &= -5 \end{aligned}$$

$$(\tan \theta - 4)(\tan \theta - 1) = 0$$

$$(x-4)(x-1) = 0$$

$$\begin{aligned} \downarrow \qquad \qquad \downarrow \\ \tan \theta - 4 &= 0 & \tan \theta - 1 &= 0 \end{aligned}$$

$$\begin{aligned} \downarrow \qquad \qquad \downarrow \\ x-4=0 & \qquad x-1=0 \\ x=4 & \qquad x=1 \end{aligned}$$

$$\textcircled{1} \tan \theta = 4 = \frac{y}{x} \qquad \tan \theta = 1 = \frac{y}{x} \textcircled{2}$$

$\theta_1 = 76^\circ = \theta_r$	$\theta_3 = 45^\circ$
$\theta_2 = 180 + 76 = 256^\circ$	$\theta_4 = 180 + 45 = 225^\circ$

RADIANS Day 2

**Example** Solve for  $x$  in the interval  $0 \leq x < 2\pi$  if  $\sin^2 x - 1 = 0$ . Give answers in exact values.

$$(\sin x + 1)(\sin x - 1) = 0$$

$\sin x + 1 = 0$   
 $\sin x = -1 = \frac{y}{r}$   
 if  $y = r$   
 then  $x = 0$   
 $x = \frac{3\pi}{2}$

$\sin x - 1 = 0$   
 $\sin x = 1 = \frac{y}{r}$   
 $x = \frac{\pi}{2}$

How would the answer change if the domain given was  $0^\circ \leq \theta < 360^\circ$ ?

$x_1 = 270^\circ$        $x_2 = 90^\circ$

**Example** Solve the following second-degree trigonometric equations on the specified domain. Give exact values where possible. Otherwise give approximate measures to the nearest hundredth.

a.  $\cos^2 x - \cos x = 2, \quad -2\pi \leq x < 2\pi$

$\cos^2 x - \cos x - 2 = 0$

$\frac{-2}{-2} \times \frac{1}{1} = -2$   
 $\frac{-2}{-2} + \frac{1}{1} = -1$   
 $(\cos x - 2)(\cos x + 1) = 0$

$\cos x - 2 = 0 \implies \cos x = 2 = \frac{x}{r}$   
 $\cos x + 1 = 0 \implies \cos x = -1$

DNE

radius is on the x-axis

$\theta_1 = \pi$   
 $\theta_2 = -\pi$

b.  $6 \cos^2 \theta + \cos \theta = 1, \quad 0^\circ \leq \theta < 360^\circ$

$6x^2 + x - 1 = 0$   
 $\frac{-2}{-2} \times \frac{3}{3} = -6$   
 $\frac{-2}{-2} + \frac{3}{3} = 1$

$3x - 1 = 0$   
 $\frac{3x}{3} = \frac{1}{3}$   
 $x = \frac{1}{3}$

$2x + 1 = 0$   
 $\frac{-1}{-1} = -1$   
 $\frac{2x}{2} = \frac{-1}{2}$   
 $x = -\frac{1}{2}$

$\theta_3 = 180 - 60 = 120^\circ$

$6x^2 - 2x + 3x - 1 = 0$   
 $2x(3x - 1) + 1(3x - 1) = 0$   
 $(3x - 1)(2x + 1) = 0$

$\cos \theta = \frac{1}{3}$   
 $\theta_1 = 71^\circ$   
 $\theta_2 = 360 - 71 = 289^\circ$

$\cos \theta = -\frac{1}{2}$   
 $\theta = 60^\circ$

$\theta_4 = 180 + 60 = 240^\circ$
